

## **The Facts about Carpet and Asthma and Allergy** *For Dealers and Consumers*

Making the right decisions about carpet starts with having the facts. That is why the Carpet and Rug Institute (CRI) sponsors scientific research and gathers data from independent sources to help professionals and the public make educated flooring choices. Visit [carpet-rug.org](http://carpet-rug.org) to learn more.

### Issue

*Carpet is perceived as a potential contributor to asthma and allergy.*

### What You Should Know

- There is no scientific study linking the rise of allergy and asthma to the use of carpet. Indeed, several studies actually disprove any correlation.
- A 15-year Swedish study found no link between carpet usage and the incidence of allergy or asthma. In fact, even when carpet usage in Sweden decreased by 70 percent, allergy reactions in the general population increased by 30 percent.<sup>1</sup>
- Carpet may even be helpful to people with asthma: an 18-nation study of nearly 20,000 people found a statistical relationship between carpeted bedrooms and reduced asthma symptoms and bronchial responsiveness.<sup>2</sup>
- A 2003 study of more than 4,600 school children in New Jersey found that having carpet in a child's bedroom was associated with fewer missed school days and less need for asthma medication.
- Carpet acts like a filter, trapping allergens away from the breathing zone so they can be removed through proper vacuuming and deep cleaning extraction. For best results removing pollutants trapped in carpet, use CRI Green Label vacuums and CRI Seal of Approval cleaning products. Details on these certification and testing programs can be found at [carpet-rug.org](http://carpet-rug.org).
  - Studies have measured the distribution of airborne dust associated with normal activities on smooth surfaces and carpeted floors. The findings show that walking on hard surfaces disturbs more particles, which become airborne and enter the breathing zone. In contrast, carpeted surfaces trap more particles so that walking disturbs fewer particles, resulting in fewer particles in the breathing zone.<sup>3</sup>
